PULS

DIMENSION **C-Series**

CPS20.121

12V, 30A, 360W, SINGLE PHASE INPUT

POWER SUPPLY

- AC 100-240V wide-range Input
- Width only 65mm
- Efficiency up to 92.6%
- ATEX and IECEx approved
- Excellent partial load efficiency
- Safe Hiccup^{PLUS} overload mode
- Easy fuse breaking due to high overload current (typ. 120A for 15ms)
- Active Power Factor Correction (PFC)
- Minimal inrush current surge
- Full power between -25°C and +60°C
- DC-OK relay contact
- Current sharing feature for parallel use
- 3 year warranty

PRODUCT DESCRIPTION

The Dimension C-Series are cost optimized power supplies without compromising quality, reliability and performance. The C-Series is part of the DIMENSION power supply family. The most outstanding features of CPS20.121 are the high efficiency, electronic inrush current limitation, active PFC, wide operational temperature range. The small size is achieved by a synchronous rectification and further technological design details.

The C-Series includes all the essential basic functions. Additionally, the CPS20.121 can deliver about 4 times the nominal output current for 15ms which helps to trip fuses on faulty output branches.

High immunity to transients and power surges as well as low electromagnetic emission, a DC-OK relay contact and a large international approval package for a variety of applications makes this unit suitable for nearly every situation.

SHORT-FORM DATA

Output voltage	DC 12V	nominal
Adjustment range	12 - 15Vdc	factory setting 12.0V
	AC 120-240V mains	
Output current	30A	up to +60°C ambient
	22.5A	at +70°C ambient
	AC 100V mains	
Output current	20.4-17.5A	up to +60°C ambient
	12.8-10.9A	at +70°C ambient
	Derate between +60°C and +70°C	
Output ripple	< 100mVpp	20Hz to 20MHz
AC Input voltage	AC 100-240V	-15%/+10%
Mains frequency	50-60Hz	±6%
AC Input current	4.1 / 2.3A	at 120 / 230Vac
Power factor	0.99 / 0.95	at 120 / 230Vac
AC Inrush current	9 / 7A peak	at 120 / 230Vac
Efficiency	91.4 / 92.6%	at 120 / 230Vac
Power losses	33.9 / 28.8W	at 120 / 230Vac
Temperature range	-25°C to +70°C	operational
Hold-up time	35 / 35ms	120 / 230Vac
Dimensions (WxHxD)	65x124x127mm	
Weight	1000g	

ORDER NUMBERS

Power Supply	**CPS20.121**	12-15V Standard unit

TERMINOLOGY AND ABREVIATIONS

PE and ⏚ symbol	PE is the abbreviation for **P**rotective **E**arth and has the same meaning as the symbol ⏚.
Earth, Ground	This document uses the term “earth” which is the same as the U.S. term “ground”.
t.b.d.	To be defined, value or description will follow later.
AC 230V	A figure displayed with the AC or DC before the value represents a nominal voltage with standard tolerances (usually ±15%) included. E.g.: DC 12V describes a 12V battery disregarding whether it is full (13.7V) or flat (10V)
230Vac	A figure with the unit (Vac) at the end is a momentary figure without any additional tolerances included.
50Hz vs. 60Hz	As long as not otherwise stated, AC 230V parameters are valid at 50Hz mains frequency.
may	A key word indicating flexibility of choice with no implied preference.
shall	A key word indicating a mandatory requirement.
should	A key word indicating flexibility of choice with a strongly preferred implementation.

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

1. INTENDED USE

This device is designed for installation in an enclosure and is intended for commercial use, such as in industrial control, process control, monitoring, measurement equipment or the like.

Do not use this device in equipment, where malfunctioning may cause severe personal injury or threaten human life without additional appropriate safety devices, that are suited for the end-application.

If this device is used in a manner outside of its specification, the protection provided by the device may be impaired.

2. INSTALLATION INSTRUCTIONS

⚠ WARNING **Risk of electrical shock, fire, personal injury or death.**

- Turn power off before working on the device and protect against inadvertent re-powering.
- Do not open, modify or repair the device.
- Use caution to prevent any foreign objects from entering into the housing.
- Do not use in wet locations or in areas where moisture or condensation can be expected.
- Do not touch during power-on, and immediately after power-off. Hot surface may cause burns.

Obey the following installation instructions:

This device may only be installed and put into operation by qualified personnel.

This device does not contain serviceable parts. The tripping of an internal fuse is caused by an internal defect.

If damage or malfunction should occur during installation or operation, immediately turn power off and send unit to the factory for inspection.

Install the device in an enclosure providing protection against electrical, mechanical and fire hazards.

Install the device onto a DIN rail according to EN 60715 with the input terminals on the bottom of the device. Other mounting orientations require a reduction in output current.

Make sure that the wiring is correct by following all local and national codes. Use appropriate copper cables that are designed for a minimum operating temperature of 60°C for ambient temperatures up to +45°C, 75°C for ambient temperatures up to +60°C and 90°C for ambient temperatures up to +70°C.

Ensure that all strands of a stranded wire enter the terminal connection. Use ferrules for wires on the input terminals. Unused screw terminals should be securely tightened.

The device is designed for pollution degree 2 areas in controlled environments. No condensation or frost is allowed.

The enclosure of the device provides a degree of protection of IP20. The enclosure does not provide protection against spilled liquids.

The device is designed for overvoltage category II zones. Below 2000m altitude the device is tested for impulse withstand voltages up to 4kV, which corresponds to OVC III according to IEC 60664-1.

The device is designed as “Class of Protection I” equipment according to IEC 61140. Do not use without a proper PE (Protective Earth) connection.

The device is suitable to be supplied from TN, TT or IT mains networks. The continuous voltage between the input terminals and the PE potential must not exceed 264Vac.

A disconnecting means shall be provided for the input of the device.

The device is designed for convection cooling and does not require an external fan. Do not obstruct airflow and do not cover ventilation grid!

The device is designed for altitudes up to 5000m. Above 2000m a reduction in output current is required.

Keep the following minimum installation clearances: 40mm on top, 20mm on the bottom, 5mm left and right side. Increase the 5mm to 15mm in case the adjacent device is a heat source. When the device is permanently loaded with less than 50%, the 5mm can be reduced to zero.

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

The device is designed, tested and approved for branch circuits up to 32A (IEC) and 30A (UL) without additional protection device. If an external fuse is utilized, do not use circuit breakers smaller than 10A B- or C-Characteristic to avoid a nuisance tripping of the circuit breaker.

The maximum surrounding air temperature is +70°C. The operational temperature is the same as the ambient or surrounding air temperature and is defined 2cm below the device.

The device is designed to operate in areas between 5% and 95% relative humidity.

Installation Instructions for Hazardous Location Areas

The device is suitable for use in Class I Division 2 Groups A, B, C, D locations and for use in Group II Category 3 (Zone 2) environments.

Classification: ATEX: EPS 13 ATEX 1 555 X, II 3G Ex ec nC IIC T3 Gc / IECEx EPS 13.0016X

WARNING EXPLOSION HAZARDS!

Substitution of components may impair suitability for this environment.

Do not disconnect the device or operate the voltage adjustment unless power has been switched off or the area is known to be non-hazardous.

A suitable enclosure must be provided for the end product which has a minimum protection of IP54 and fulfils the requirements of the EN 60079-0.

3. AC-INPUT

AC input	nom.	AC 100-240V	suitable for TN-, TT- and IT mains networks
AC input range		85-264Vac	no damage between 0 and 85Vac
		264-300Vac	< 500ms
Allowed voltage L or N to earth	max.	300Vac	continuous, IEC 62103
Input frequency	nom.	50–60Hz	±6%
Turn-on voltage	typ.	84Vac	steady-state value, see Fig. 3-1
Shut-down voltage	typ.	33Vac	steady-state value at 7.5A load, see Fig. 3-1
	typ.	45Vac	steady-state value at 15A load, see Fig. 3-1
	typ.	62Vac	steady-state value at 30A load, see Fig. 3-1
External input protection	See recommendations in chapter 23.3.		

		AC 100V	**AC 120V**	**AC 230V**	
Input current	typ.	4.0A	3.3A	1.8A	at 12V, 30A, see Fig. 3-3
		4.4A	3.7A	2.0A	at 15V, 27A
Power factor*)	typ.	0.99	0.99	0.95	at 12V, 30A, see Fig. 3-4
Crest factor**)	typ.	1.5	1.5	1.65	at 12V, 30A
Start-up delay	typ.	900ms	850ms	700ms	see Fig. 3-2
Rise time	typ.	72ms	72ms	72ms	at 12V, 30A const. current load, 0mF load capacitance, see Fig. 3-2
	typ.	120ms	120ms	120ms	at 12V, 30A const. current load, 30mF load capacitance, see Fig. 3-2
Turn-on overshoot	max.	200mV	200mV	200mV	see Fig. 3-2

*) The power factor is the ratio of the true (or real) power to the apparent power in an AC circuit.

**) The crest factor is the mathematical ratio of the peak value to RMS value of the input current waveform.

Fig. 3-1 **Input voltage range**

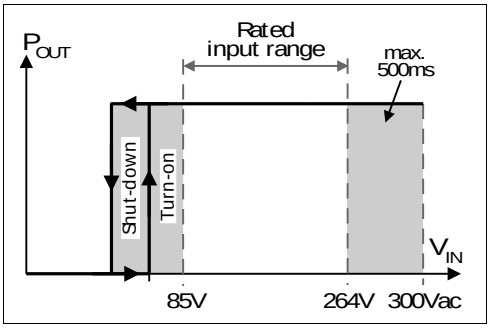

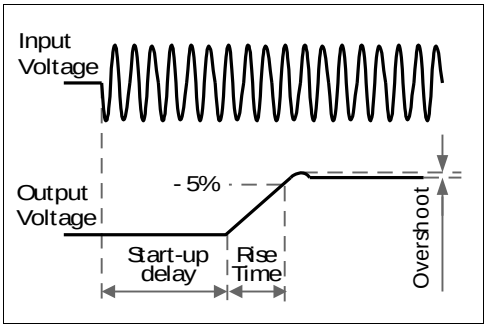

Fig. 3-2 **Turn-on behavior, definitions**

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

Fig. 3-3 **Input current vs. output load at 12V**

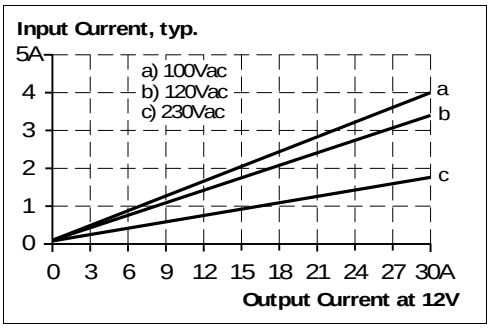

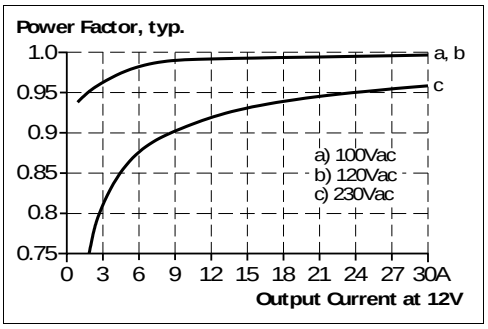

Fig. 3-4 **Power factor vs. output load at 12V**

4. DC-INPUT

Do not operate this power supply with DC-input voltage.

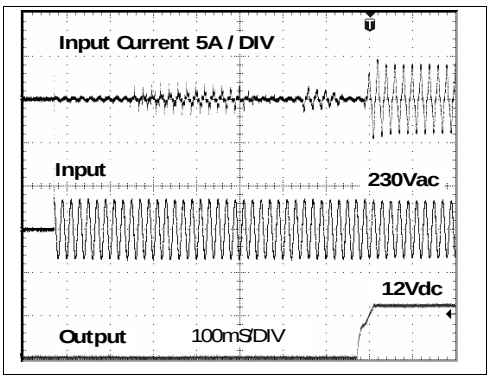

5. INPUT INRUSH CURRENT

An active inrush limitation circuit limits the input inrush current after turn-on of the input voltage.

The charging current into EMI suppression capacitors is disregarded in the first microseconds after switch-on.

		AC 100V	AC 120V	AC 230V	
Inrush current	max.	$13A_{peak}$	$13A_{peak}$	$13A_{peak}$	temperature independent
	typ.	$11A_{peak}$	$9A_{peak}$	$7A_{peak}$	temperature independent
Inrush energy	max.	$2A^2s$	$2.5A^2s$	$0.5A^2s$	temperature independent

Fig. 5-1 **Typical input inrush current behaviour at nominal load and 25°C ambient**

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

6. OUTPUT

Output voltage	nom.	12V	
Adjustment range		12-15V	guaranteed
	max.	16.5V*)	at clockwise end position of potentiometer
Factory settings	typ.	12.0V	±0.2%, at full load, cold unit, in "single use" mode
	typ.	12.0V	±0.2%, at full load, cold unit, in "parallel use" mode
	typ.	12.5V	at no load, cold unit, in "parallel use" mode
Line regulation	max.	10mV	85-300Vac
Load regulation	max.	100mV	in "single use" mode: static value, 0A → 30A; see Fig. 6-1
	typ.	500mV	in "parallel use" mode: static value, 0A → 30A, see Fig. 6-2
Ripple and noise voltage	max.	100mVpp	20Hz to 20MHz, 50Ohm
Output current	nom.	30A	at 12V, see Fig. 6-1
	nom.	27A	at 15V, see Fig. 6-1
	typ.	120A	up to 15ms, output voltage stays above 10V, see Fig. 6-4, This peak current is available once every five seconds. See chapter 23.1 for more peak current measurements.
Output power	nom.	360W	at 12V
	nom.	405W	at 15V
Overload behaviour		cont. current	output voltage > 6Vdc, see Fig. 6-1
		Hiccup*PLUS* mode**)	output voltage < 6Vdc, see Fig. 6-1
Short-circuit current	min.	35A***)	load impedance <10mOhm, see Fig. 6-3
	max.	42A***)	load impedance <10mOhm, see Fig. 6-3
	max.	12.6A***)	average (R.M.S.) current, load impedance 25mOhm, see Fig. 6-3
	min.	120A	up to 15ms, load impedance <10mOhm, see Fig. 6-4
	typ.	130A	up to 15ms, load impedance <10mOhm, see Fig. 6-4
Output capacitance	typ.	5 600µF	included inside the power supply

*) This is the maximum output voltage which can occur at the clockwise end position of the potentiometer due to tolerances. It is not guaranteed value which can be achieved. The typical value is about 15.8V (in "single use" mode).

) **Hiccup*PLUS* Mode
At heavy overloads (when output voltage falls below 6V), the power supply delivers continuous output current for 2s. After this, the output is switched off for approx. 18s before a new start attempt is automatically performed. This cycle is repeated as long as the overload exists. If the overload has been cleared, the device will operate normally. See Fig. 6-3.

***) Discharge current of output capacitors is not included.

7. HOLD-UP TIME

		AC 100V	AC 120V	AC 230V	
Hold-up Time	typ.	80ms	80ms	80ms	at 12V, 15A, see Fig. 7-1
	min.	67ms	67ms	67ms	at 12V, 15A, see Fig. 7-1
	typ.	35ms	35ms	35ms	at 12V, 30A, see Fig. 7-1
	min.	29ms	29ms	29ms	at 12V, 30A, see Fig. 7-1

Fig. 7-1 **Hold-up time vs. input voltage**

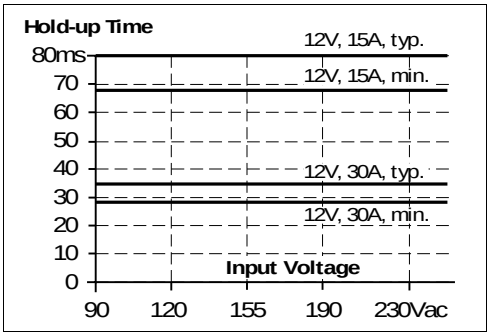

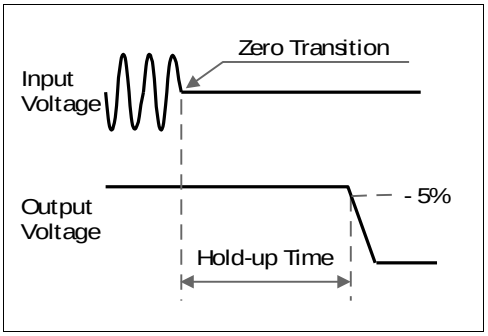

Fig. 7-2 **Shut-down behavior, definitions**

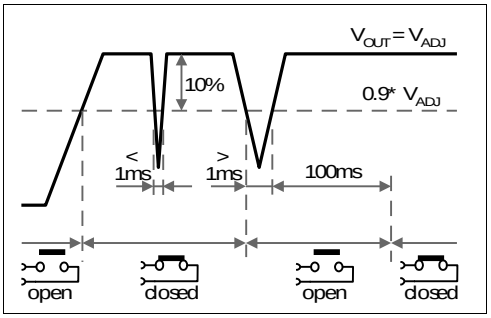

8. DC-OK RELAY CONTACT

This feature monitors the output voltage, which is produced by the power supply itself. It is independent of a back-fed voltage from a unit connected in parallel to the power supply output.

Contact closes	As soon as the output voltage reaches 90% of the adjusted output voltage level.		
Contact opens	As soon as the output voltage dips more than 10% below the adjusted output voltage. Short dips will be extended to a signal length of 100ms. Dips shorter than 1ms will be ignored.		
Contact ratings	max.	60Vdc 0.3A, 30Vdc 1A, 30Vac 0.5A	resistive load
	min.	1mA at 5Vdc	min. permissible load
Isolation voltage	See dielectric strength table in chapter 18.		

Fig. 8-1 **DC-OK relay contact behavior**

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

9. EFFICIENCY AND POWER LOSSES

		AC 100V	AC 120V	AC 230V	
Efficiency	typ.	90.9%	91.4%	92.6%	at 12V, 30A
Average efficiency*)	typ.	90.0%	90.5%	91.6%	25% at 7.5A, 25% at 15A, 25% at 22.5A. 25% at 30A
Power losses	typ.	6.8W	5.2W	3.0W	at 12V, 0A
	typ.	19.1W	18.1W	15.5W	at 12V, 15A
	typ.	36.0W	33.9W	28.8W	at 12V, 30A

*) The average efficiency is an assumption for a typical application where the power supply is loaded with 25% of the nominal load for 25% of the time, 50% of the nominal load for another 25% of the time, 75% of the nominal load for another 25% of the time and with 100% of the nominal load for the rest of the time.

Fig. 9-1 **Efficiency vs. output current at 12V, typ.**

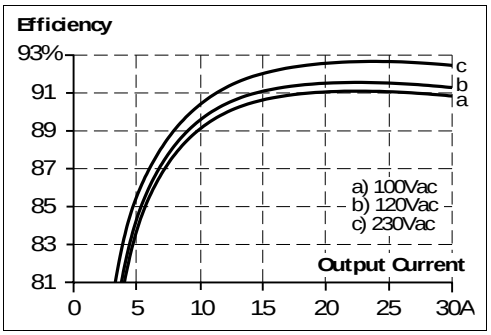

Fig. 9-2 **Losses vs. output current at 12V, typ.**

10. LIFETIME EXPECTANCY AND MTBF

	AC 100V	AC 120V	AC 230V	
Lifetime expectancy*)	168 000h*)	170 000h*)	174 000h*)	at 12V, 15A and +40°C
	475 000h*)	481 000h*)	492 000h*)	at 12V, 15A and +25°C
	50 000h	50 000h	54 000h	at 12V, 30A and +40°C
	141 000h*)	141 000h*)	153 000h*)	at 12V, 30A and +25°C
MTBF **) SN 29500, IEC 61709	413 000h	428 000h	554 000h	at 12V, 30A and +40°C
	702 000h	728 000h	776 000h	at 12V, 30A and +25°C
MTBF **) MIL HDBK 217F	253 000h	259 000h	278 000h	at 12V, 30A and +40°C; Ground Benign GB40
	353 000h	358 000h	380 000h	at 12V, 30A and +25°C; Ground Benign GB25
	61 000h	62 000h	68 000h	at 12V, 30A and +40°C; Ground Fixed GF40
	82 000h	83 000h	91 000h	at 12V, 30A and +25°C; Ground Fixed GF25

*) The **Lifetime expectancy** shown in the table indicates the minimum operating hours (service life) and is determined by the lifetime expectancy of the built-in electrolytic capacitors. Lifetime expectancy is specified in operational hours and is calculated according to the capacitor's manufacturer specification. The manufacturer of the electrolytic capacitors only guarantees a maximum life of up to 15 years (131 400h). Any number exceeding this value is a calculated theoretical lifetime which can be used to compare devices.

) **MTBF stands for **M**ean **T**ime **B**etween **F**ailures, which is calculated according to statistical device failures, and indicates reliability of a device. It is the statistical representation of the likelihood of a unit to fail and does not necessarily represent the life of a product.
The MTBF figure is a statistical representation of the likelihood of a device to fail. A MTBF figure of e.g. 1 000 000h means that statistically one unit will fail every 100 hours if 10 000 units are installed in the field. However, it can not be determined if the failed unit has been running for 50 000h or only for 100h.

11. FUNCTIONAL DIAGRAM

Fig. 11-1 **Functional diagram**

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

12. TERMINALS AND WIRING

The terminals are IP20 Finger safe constructed and suitable for field- and factory wiring.

	Input and output	**DC-OK-Signal**
Type	screw terminals	spring-clamp terminals
Solid wire	0.5-6mm²	0.15-1.5mm²
Stranded wire	0.5-4mm²	0.15-1.5mm²
American Wire Gauge	AWG20-10	AWG26-14
Max. wire diameter	2.8mm (including ferrules)	1.5mm (including ferrules)
Wire stripping length	7mm	7mm
Screwdriver	3.5mm slotted or cross-head No 2	3.5mm slotted (to open the spring)
Recommended tightening torque	1Nm	not applicable

Instructions:

a) Use appropriate copper cables that are designed for minimum operating temperatures of:
60°C for ambient up to 45°C and
75°C for ambient up to 60°C minimum
90°C for ambient up to 70°C minimum.
b) Follow national installation codes and installation regulations!
c) Ensure that all strands of a stranded wire enter the terminal connection!
d) Do not use the unit without PE connection.
e) Unused terminal compartments should be securely tightened.
f) Ferrules are allowed.

Daisy chaining:

Daisy chaining (jumping from one power supply output to the next) is allowed as long as the average output current through one terminal pin does not exceed 25A. If the current is higher, use a separate distribution terminal block as shown in Fig. 12-2.

Fig. 12-1 Daisy chaining of outputs

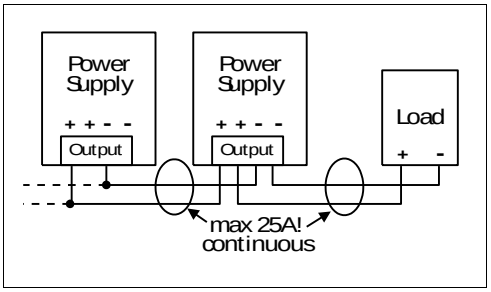

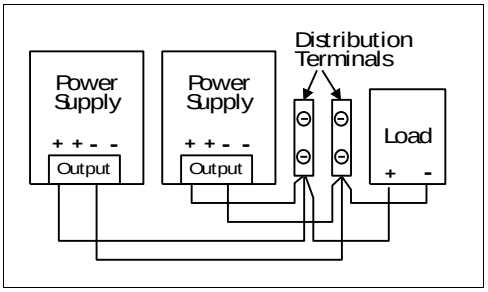

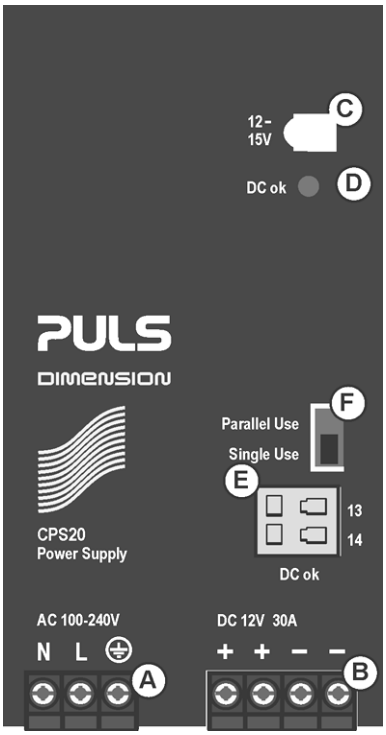

Fig. 12-2 Using distribution terminals

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

13. FRONT SIDE AND USER ELEMENTS

Fig. 13-1 **Front side**

A **Input Terminals** (screw terminals)
- **N, L** Line input
- ⏚ PE (Protective Earth) input

B **Output Terminals** (screw terminals, two pins per pole)
- **+** Positive output
- **–** Negative (return) output

C **Output voltage potentiometer**
Open the flap to adjust the output voltage. Factory set: 12.0V

D **DC-OK LED** (green)
On, when the output voltage is >90% of the adjusted output voltage

E **DC-OK Relay Contact** (quick-connect spring-clamp terminals)
The DC-OK relay contact is synchronized with the DC-OK LED.
See chapter 8 for details.

F **"Parallel Use" "Single Use" selector**
Set jumper to "Parallel Use" when power supplies are connected in parallel to increase the output power. In order to achieve a sharing of the load current between the individual power supplies, the "parallel use" regulates the output voltage in such a manner that the voltage at no load is approx. 4% higher than at nominal load. See also chapter 23.5. A missing jumper is equal to a "Single Use" mode.

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

14. EMC

The power supply is suitable for applications in industrial environment as well as in residential, commercial and light industry environment without any restrictions. A detailed EMC report is available on request.

EMC Immunity	According generic standards: EN 61000-6-1 and EN 61000-6-2			
Electrostatic discharge	EN 61000-4-2	contact discharge	8kV	Criterion A
		air discharge	15kV	Criterion A
Electromagnetic RF field	EN 61000-4-3	80MHz-2.7GHz	20V/m	Criterion A
Fast transients (Burst)	EN 61000-4-4	input lines	4kV	Criterion A
		output lines	2kV	Criterion A
		DC-OK signal (coupling clamp)	2kV	Criterion A
Surge voltage on input	EN 61000-4-5	L → N	2kV	Criterion A
		L → PE, N → PE	4kV	Criterion A
Surge voltage on output	EN 61000-4-5	+ → -	1kV	Criterion A
		+ / - → PE	2kV	Criterion A
Surge voltage on DC-OK	EN 61000-4-5	DC-OK signal → PE	1kV	Criterion A
Conducted disturbance	EN 61000-4-6	0.15-80MHz	20V	Criterion A
Mains voltage dips	EN 61000-4-11	0% of 100Vac	0Vac, 20ms	Criterion A
		40% of 100Vac	40Vac, 200ms	Criterion C
		70% of 100Vac	70Vac, 500ms	Criterion A
		0% of 200Vac	0Vac, 20ms	Criterion A
		40% of 200Vac	80Vac, 200ms	Criterion A
		70% of 200Vac	140Vac, 500ms	Criterion A
Voltage interruptions	EN 61000-4-11	0% of 200Vac (=0V)	5000ms	Criterion C
Voltage sags	SEMI F47	dips on the input voltage according to SEMI F47 standard		
		80% of 120Vac (96Vac)	1000ms	Criterion A
		70% of 120Vac (84Vac)	500ms	Criterion A
		50% of 120Vac (60Vac)	200ms	Criterion A
Powerful transients	VDE 0160	over entire load range	750V, 1.3ms	Criterion A

Criterions:

A: Power supply shows normal operation behavior within the defined limits.

C: Temporary loss of function is possible. Power supply may shut-down and restarts by itself. No damage or hazards for the power supply will occur.

EMC Emission	According generic standards: EN 61000-6-3 and EN 61000-6-4

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

18. DIELECTRIC STRENGTH

The output voltage is floating and has no ohmic connection to the ground. Type and factory tests are conducted by the manufacturer. Field tests may be conducted in the field using the appropriate test equipment which applies the voltage with a slow ramp (2s up and 2s down). Connect all input-terminals together as well as all output poles before conducting the test. When testing, set the cut-off current settings to the value in the table below.

Fig. 18-1 **Dielectric strength**

		A	B	C	D
Type test	60s	2500Vac	3000Vac	1000Vac	500Vac
Factory test	5s	2500Vac	2500Vac	500Vac	500Vac
Field test	5s	2000Vac	2000Vac	500Vac	500Vac
Cut-off current setting		> 15mA	> 15mA	> 20mA	> 1mA

To fulfil the PELV requirements according to EN60204-1 § 6.4.1, we recommend that either the + pole, the – pole or any other part of the output circuit shall be connected to the protective earth system. This helps to avoid situations in which a load starts unexpectedly or can not be switched off when unnoticed earth faults occur.

B*) When testing input to DC-OK ensure that the max. voltage between DC-OK and the output is not exceeded (column D). We recommend connecting DC-OK pins and the output pins together when performing the test.

22. ACCESSORIES

22.1. ZM2.WALL - WALL MOUNTING BRACKET

This bracket is used to mount the power supply onto a flat surface without utilizing a DIN rail.

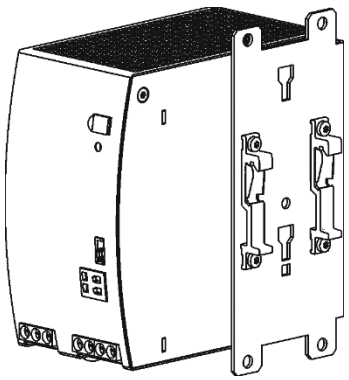

Due to the small size of the unit, it is required that the black-DIN rail slide on the back of the unit must be removed. Instructions how to do this can be found in the manual of the ZM2.WALL.

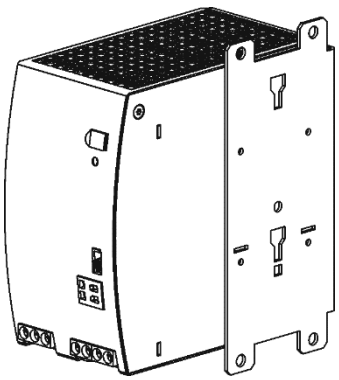

22.2. ZM13.SIDE - SIDE MOUNTING BRACKET

This bracket is used to mount DIMENSION units sideways with or without utilizing a DIN rail. The two aluminum brackets and the black plastic slider of the unit have to be detached, so that the steel brackets can be mounted.

For sideway DIN rail mounting, the removed aluminum brackets and the black plastic slider need to be mounted on the steel bracket.

Side mounting with DIN rail brackets

Side mounting without DIN rail brackets

22.3. YR80.242 - REDUNDANCY MODULES

(2x 40A Inputs, 1x 80A output)

The YR80.242 is the preferred redundancy module for the CPS20.121 power supply. It is equipped with two input channels, which are individually decoupled by utilizing mosfet technology. Using mosfets instead of diodes reduces the heat generation and the voltage drop between input and output. The YR80.242 does not require an additional auxiliary voltage and is self- powered even in case of a short circuit across the output.

Due to the low power losses, the unit is very slender and only requires 46mm width on the DIN rail.

22.4. YR40.245 - REDUNDANCY MODULES

(1x 40A input, 1x 40A output)

The YR40.245 is a 40A single channel redundancy module, which is equipped with a plug connector on the output. The plug connector allows replacing the power supply or the redundancy module while the system is running. The plug connector avoids that the output wires can touch and short the load circuit.

The YR40.245 is very slender and only requires 46mm width on the DIN rail. It also utilizes mosfet technology instead of diodes for low heat generation and a minimal voltage drop between input and output. It does not require an additional auxiliary voltage and is self-powered even in case of a short circuit across the output.

Fig. 22-1 **Typical 1+1 Redundant configuration for 30A with a dual redundancy module**

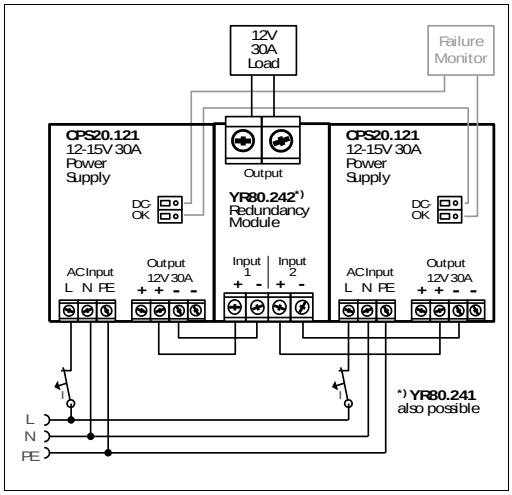

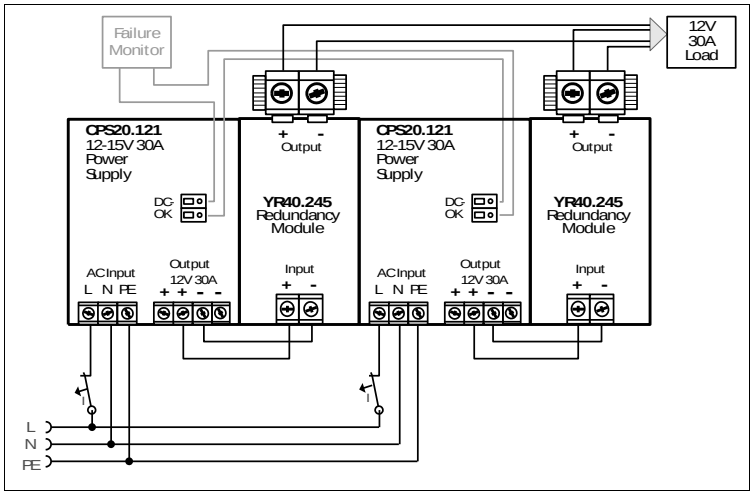

Fig. 22-2 **Typical N+1 or 1+1 Redundant configuration for 30A with multiple YR40.245 redundancy modules**

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

23. APPLICATION NOTES

23.1. PEAK CURRENT CAPABILITY

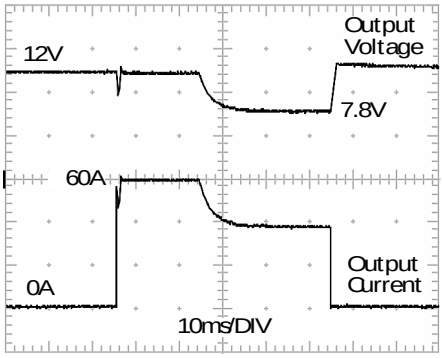

The power supply can deliver peak currents (up to several milliseconds) which are higher than the specified short term currents.

This helps to start current demanding loads. Solenoids, contactors and pneumatic modules often have a steady state coil and a pick-up coil. The inrush current demand of the pick-up coil is several times higher than the steady-state current and usually exceeds the nominal output current (including the PowerBoost). The same situation applies when starting a capacitive load.

The peak current capability also ensures the safe operation of subsequent circuit breakers of load circuits. The load branches are often individually protected with circuit breakers or fuses. In case of a short or an overload in one branch circuit, the fuse or circuit breaker need a certain amount of over-current to open in a timely manner. This avoids voltage loss in adjacent circuits.

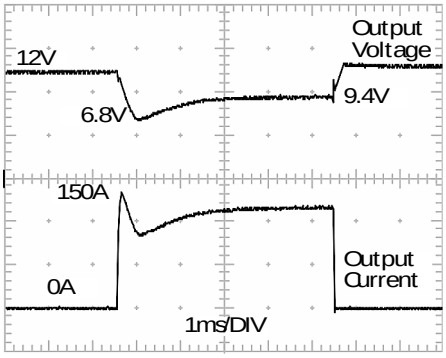

The extra current (peak current) is supplied by the power converter and the built-in large sized output capacitors of the power supply. The capacitors get discharged during such an event, which causes a voltage dip on the output. The following two examples show typical voltage dips:

Fig. 23-1 **Peak load with 2x the nominal current for 50ms, typ.**

60A Peak load (resistive) for 50ms
Output voltage dips from 12V to 7.8V.

Fig. 23-2 **Peak load with 5x the nominal current for 5ms, typ.**

150A Peak load (resistive) for 5ms
Output voltage dips from 12V to 9.4V.

Peak current voltage dips	typ.	from 12V to 7.8V	at 60A for 50ms, resistive load
	typ.	from 12V to 9.0V	at 150A for 2ms, resistive load
	typ.	from 12V to 9.4V	at 150A for 5ms, resistive load

23.2. BACK-FEEDING LOADS

Loads such as decelerating motors and inductors can feed voltage back to the power supply. This feature is also called return voltage immunity or resistance against Back- E.M.F. (Electro Magnetic Force).

This power supply is resistant and does not show malfunctioning when a load feeds back voltage to the power supply. It does not matter whether the power supply is on or off.

The maximum allowed feed-back-voltage is 16Vdc. The absorbing energy can be calculated according to the built-in large sized output capacitor which is specified in chapter 6.

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

23.3. EXTERNAL INPUT PROTECTION

The unit is tested and approved for branch circuits up to 30A (UL) and 32A (IEC). An external protection is only required if the supplying branch has an ampacity greater than this. Check also local codes and local requirements. In some countries local regulations might apply.

If an external fuse is necessary or utilized, minimum requirements need to be considered to avoid nuisance tripping of the circuit breaker. A minimum value of 10A B- or C-Characteristic breaker should be used.

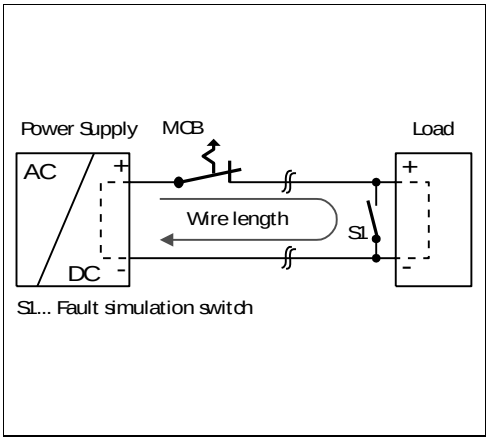

23.4. OUTPUT CIRCUIT BREAKERS

Standard miniature circuit breakers (MCB's or UL 1077 circuit breakers) are commonly used for AC-supply systems and may also be used on 12V branches.

MCB's are designed to protect wires and circuits. If the ampere value and the characteristics of the MCB are adapted to the wire size that is used, the wiring is considered as thermally safe regardless of whether the MCB opens or not.

To avoid voltage dips and under-voltage situations in adjacent 12V branches which are supplied by the same source, a fast (magnetic) tripping of the MCB is desired. A quick shutdown within 10ms is necessary corresponding roughly to the ride-through time of PLC's. This requires power supplies with high current reserves and large output capacitors. Furthermore, the impedance of the faulty branch must be sufficiently small in order for the current to actually flow. The best current reserve in the power supply does not help if Ohm's law does not permit current flow. The following table has typical test results showing which B- and C-Characteristic MCBs magnetically trip depending on the wire cross chapter and wire length.

Fig. 23-3 **Test circuit**

Maximal wire length*) for a fast (magnetic) tripping:

	0.75mm²	**1.0mm²**	**1.5mm²**	**2.5mm²**
C-3A	9m	12m	18m	26m
C-4A	7m	10m	14m	22m
C-6A	4m	6m	10m	14m
C-8A	3m	5m	8m	12m
C-10A	3m	4m	7m	10m
B-6A	8m	11m	14m	24m
B-10A	5m	7m	10m	17m
B-13A	4m	6m	9m	14m
B-16A	3m	5m	7m	11m

*) Don't forget to consider twice the distance to the load (or cable length) when calculating the total wire length (+ and – wire).

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

23.5. PARALLEL USE TO INCREASE OUTPUT POWER

CPS20.121 power supplies can be paralleled to increase the output power. The output voltage of all power supplies shall be adjusted to the same value (±100mV) in "Single use" mode with the same load conditions on all units, or the units can be left with the factory settings. After the adjustments, the jumper on the front of the unit shall be moved from "Single use" to "Parallel use", in order to achieve load sharing. The "Parallel use" mode regulates the output voltage in such a manner that the voltage at no load is approx. 4% higher than at nominal load. See also chapter 6. If no jumper is plugged in, the unit is in "Single use" mode. Factory setting is "Single use" mode.

If more than three units are connected in parallel, a fuse or circuit breaker with a rating of 40A or 50A is required on each output. Alternatively, a diode or redundancy module can also be utilized.

Energize all units at the same time to avoid the overload Hiccup^{PLUS} mode. It also might be necessary to cycle the input power (turn-off for at least five seconds), if the output was in Hiccup^{PLUS} mode due to overload or short circuits and the required output current is higher than the current of one unit.

Keep an installation clearance of 15mm (left / right) between two power supplies and avoid installing the power supplies on top of each other. Do not use power supplies in parallel in mounting orientations other than the standard mounting orientation (terminals on bottom of the unit) or in any other condition where a derating of the output current is required (e.g. altitude, above 60°C, …).

Pay attention that leakage current, EMI, inrush current, harmonics will increase when using multiple power supplies.

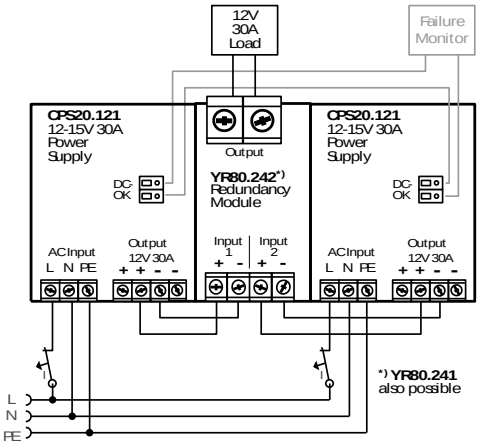

23.6. PARALLEL USE FOR REDUNDANCY

Power supplies can be paralleled for redundancy to gain higher system availability. Redundant systems require a certain amount of extra power to support the load in case one power supply unit fails. The simplest way is to put two power supplies in parallel. This is called a 1+1 redundancy. In case one power supply unit fails, the other one is automatically able to support the load current without any interruption. Redundant systems for a higher power demand are usually built in a N+1 method. E.g. five power supplies, each rated for 30A are paralleled to build a 120A redundant system. For N+1 redundancy the same restrictions apply as for increasing the output power, see also chapter 23.5.

Please note: This simple way to build a redundant system does not cover failures such as an internal short circuit in the secondary side of the power supply. In such a case, the defective unit becomes a load for the other power supplies and the output voltage can not be maintained any more. This can be avoided by utilizing redundancy modules, which have decoupling devices (diodes or mosfets) included. Further information and wiring configurations can be found in chapter 22.3.

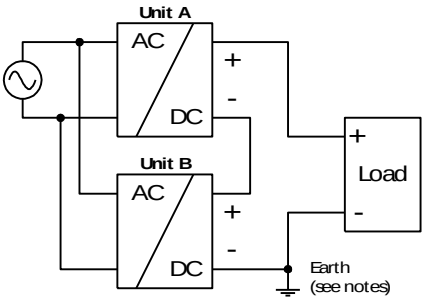

Recommendations for building redundant power systems:

a) Use separate input fuses for each power supply.
b) Set the power supply into "Parallel use" mode.
c) Monitor the individual power supply units. Therefore, use the DC-OK relay contact of the CPS20 power supply.
d) It is desirable to set the output voltages of all units to the same value (± 100mV) or leave it at the factory setting.

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

23.7. SERIES OPERATION

Power supplies of the same type can be connected in series for higher output voltages. It is possible to connect as many units in series as needed, providing the sum of the output voltage does not exceed 150Vdc. Voltages with a potential above 60Vdc are not SELV any more and can be dangerous. Such voltages must be installed with a protection against touching.

Earthing of the output is required when the sum of the output voltage is above 60Vdc.

Avoid return voltage (e.g. from a decelerating motor or battery) which is applied to the output terminals.

Keep an installation clearance of 15mm (left / right) between two power supplies and avoid installing the power supplies on top of each other. Do not use power supplies in series in mounting orientations other than the standard mounting orientation (terminals on bottom of the unit).

Pay attention that leakage current, EMI, inrush current, harmonics will increase when using multiple power supplies.

23.8. INDUCTIVE AND CAPACITIVE LOADS

The unit is designed to supply any kind of loads, including capacitive and inductive loads. If extreme large capacitors, such as EDLCs (electric double layer capacitors or "UltraCaps") with a capacitance > 1.25F are connected to the output, the unit might charge the capacitor in the Hiccup^{PLUS} mode (see chapter 6).

23.9. CHARGING OF BATTERIES

The power supply can be used to charge 12V lead-acid or maintenance free batteries.

Instructions for charging batteries:

a) Set output voltage (measured at no load and at the battery end of the cable) very precisely to the end-of-charge voltage.

End-of-charge voltage	13.9V	13.75V	13.6V	13.45V
Battery temperature	10°C	20°C	30°C	40°C

b) Use a 40A or 50A circuit breaker (or blocking diode) between the power supply and the battery.

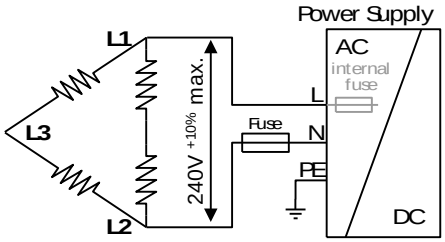

c) Ensure that the output current of the power supply is below the allowed charging current of the battery.

d) The return current to the power supply (battery discharge current) is typ. 42mA when the power supply is switched off (except in case a blocking diode is utilized).

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

23.10. OPERATION ON TWO PHASES

The power supply can also be used on two-phases of a three-phase-system. Such a phase-to-phase connection is allowed as long as the supplying voltage is below 240V$^{+10\%}$.

23.11. USE IN A TIGHTLY SEALED ENCLOSURE

When the power supply is installed in a tightly sealed enclosure, the temperature inside the enclosure will be higher than outside. In such situations, the inside temperature defines the ambient temperature for the power supply.

The following measurement results can be used as a reference to estimate the temperature rise inside the enclosure.

The power supply is placed in the middle of the box, no other heat producing items are inside the box

Enclosure:	Rittal Typ IP66 Box PK 9522 100, plastic, 254x180x165mm
Load:	12V, 24A; (=80%) load is placed outside the box
Input:	230Vac
Temperature inside enclosure:	58.5°C (in the middle of the right side of the power supply with a distance of 2cm)
Temperature outside enclosure:	23.3°C
Temperature rise:	35.2K

LRI Distribuída no Brasil pela LRI | vendas@lri.com.br | 51 2129-3000

23.12. MOUNTING ORIENTATIONS

Mounting orientations other than all terminals on the bottom require a reduction in continuous output power or a limitation in the maximum allowed ambient temperature. The amount of reduction influences the lifetime expectancy of the power supply. Therefore, two different derating curves for continuous operation can be found below:

Curve A1 Recommended output current.
Curve A2 Max allowed output current (results in approximately half the lifetime expectancy of A1).
